## Natural Selection of Leaf Thickness on Planet Eorthe, Galaxy Tlaloc <br> A Carolina Essentials ${ }^{\text {s" }}$ Activity <br> Student Worksheet <br> Overview <br> The year is 3030 and intergalactic space travel is common. You are part of an agricultural

 team sent to Eorthe, in the Tlaloc galaxy, to initiate an agricultural program with a genetically engineered plant, XR-45.XR-45 is similar to a soybean plant, with large leaves and fruit produced in pods. There are 3 naturally occurring varieties of XR-45, identified by the thickness of leaves, ranging from less than 0.5 mm thick to slightly over 1.0 mm thick. The varieties are represented in equal proportions in the initial seed stock of $5,000,000$ seeds. The fruit of XR-45 is highly nutritious, and it can be eaten raw or cooked. It can also be ground into flour. The roots of the plant are similar to potatoes. Your team is assigned to keep detailed records of plant growth, fruit production, and evidence of XR-45's adaptation to the Eorthen environment.
Eorthe is similar to Earth in size, and its atmosphere consists of oxygen, water vapor, carbon dioxide, nitrogen, hydrogen, and helium. Eorthe's atmosphere is higher in oxygen, carbon dioxide, and helium and lower in nitrogen and ozone than Earth's atmosphere. Because Eorthe's sun is a binary star system and not a single star, and Eorthe's axis is tilted at 18 degrees instead of 23 degrees, seasons are quite different on Eorthe. There are 2 sets of spring- and summer-type seasons with frequent all-day rain in the spring and sparse, nightly rain in the summer, followed by a long period of dry, cold temperatures (similar to fall in the northern latitudes of North America).

Consequently, there are 2 growing seasons on Eorthe: planting can be done in both early springs and harvesting done in the early falls. Soil on Eorth contains higher amounts of ammonia and nitrate salts than soil on Earth, so there is little need for typical fertilizers.

## Phenomenon

These are examples of leaves. How can they be used as evidence for adaptation among plants?

## Essential Question

How can data be used to support an argument that natural selection is occurring in an organism?

## Activity Objectives

1. Use data to explain if natural selection may be taking place.
2. Use data to argue that adaptations in the plants are taking place since their arrival on Eorthe.

## Safety

No PPE is required for the activity.

## Activity Procedures

1. Graph the information for numbers of plants according to leaf thickness. Time should be on the x-axis and should include year and season. Color-code or symbol-code the 3 plant variations.
2. Calculate the average number of plants of each variety per a 1000 plant random sample for each year.
3. Your teacher may direct you to calculate summary descriptive statistics for each variety of plant.
4. Graph the information for numbers of fruit produced by leaf variation. Time should be on the $x$-axis and should include year and season. Color-code or symbol-code the 3 plant variations.
5. Calculate the average number of fruits for each variety per a 1000 plant random sample for each year.
6. Your teacher may direct you to calculate summary descriptive statistics for each variety of plant.

## Data and Observations

Plant Data

| Number of XR-45 Plants/1000 Plant Random Sample by Leaf Thickness (mm) |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Year | Season | Leaf Thickness <br> <0.5 mm | Leaf Thickness <br> $\mathbf{0 . 5 - 1 . 0 ~ m m ~}$ | Leaf Thickness <br> $\mathbf{> 1 . 0} \mathbf{~ m m}$ |
| 3030 | Spring 1 | 320 | 342 | 338 |
|  | Spring 2 | 315 | 344 | 341 |
|  | Summer 1 | 316 | 338 | 346 |
|  | Summer 2 | 303 | 335 | 362 |
| 3031 | Spring 1 | 302 | 331 | 367 |
|  | Spring 2 | 299 | 331 | 370 |
|  | Summer 1 | 299 | 330 | 371 |
|  | Summer 2 | 283 | 332 | 385 |
| 3032 | Spring 1 | 282 | 329 | 389 |
|  | Spring 2 | 280 | 300 | 420 |
|  | Summer 1 | 280 | 298 | 422 |
|  | Summer 2 | 260 | 287 | 453 |
| 3033 | Spring 1 | 258 | 288 | 454 |
|  | Spring 2 | 255 | 287 | 458 |
|  | Summer 1 | 254 | 288 | 458 |
|  | Summer 2 | 250 | 287 | 463 |

XR-45 Leaf Thickness and Number of Fruit (1000 plant random sample)

| Year | Season | Average <br> Number of <br> Fruit/Plant <br> (Thin Leaf) | Average <br> Number of <br> Fruit/Plant <br> (Moderate Leaf) | Average <br> Number of <br> Fruit/Plant <br> (Thick Leaf) |
| :--- | :--- | :--- | :--- | :--- |
| 3030 | Summer 1 | 12 | 14 | 18 |
| 3030 | Summer 2 | 14 | 14 | 17 |
| 3031 | Summer 1 | 9 | 14 | 19 |
| 3031 | Summer 2 | 9 | 13 | 19 |
| 3032 | Summer 1 | 9 | 12 | 20 |
| 3032 | Summer 2 | 7 | 13 | 18 |
| 3033 | Summer 1 | 4 | 10 | 19 |
| 3033 | Summer 2 | 3 | 8 | 21 |

## Analysis and Discussion

1. What is the percent abundance of each variety of XR-45 at spring 1 of 3030, at summer 2 of $3030,3031,3032,3033$ ?

| Year | $<\mathbf{0 . 5} \mathbf{~ m m}$ | $\mathbf{0 . 5} \mathbf{- 1 . 0 ~ m m}$ | $>1.0 \mathrm{~mm}$ |
| :--- | :--- | :--- | :--- |
| Spring 1 3030 |  |  |  |
| Summer 2 3030 |  |  |  |
| Summer 2 3031 |  |  |  |
| Summer 2 3032 |  |  |  |
| Summer 2 3033 |  |  |  |

2. Use the data, statistics, and graph to explain the trend in abundance of each variation in leaf thickness within the 1000 plant samples.
3. Use the data, statistics, and graph to explain the trend in abundance of fruit for each leaf thickness variation within the 1000 plant samples.
4. Explain the difference in fruit production among the 3 variations of plant leaf thickness that could lead to increased survival.
5. Use your data to explain if natural selection and adaptation may be taking place in the plants since being transplanted to Eorthe.
